Isolated pancreatojejunostomy after pancreatoduodenectomy (PD) can reduce the severity of pancreatic fistula and may be a good option for young patients with benign or low-grade neoplasms as well as for patients with a soft pancreas and high risk of clinically relevant postoperative pancreatic fistula (POPF). It may increase the surgical reconstruction

time, but not the overall time, because the resection phase usually is easier in those cases. This procedure can be performed safely with the robotic platform. This video can help oncologic surgeons perform this complex procedure (<https://doi.org/10.1245/s10434-025-17037-x>).
